Sync GeeksforGeeks Solutions to GitHub

Step-by-Step Setup

### 1. Prerequisites

Make sure you have accounts on both platforms:

- Create or sign in to GitHub
- Create or sign in to GeeksforGeeks

2. Install the Chrome Extension

Go to the official Chrome extension:

- GFG to GitHub – Chrome Web Store
- Click "Add to Chrome"

Once added, you'll see the extension icon appear in your Chrome toolbar.

3. Authenticate the Extension with GitHub

- Click the Extensions (puzzle icon) in Chrome → Click "GFG to GitHub"
- A small pop-up opens — click Authenticate
- It will open a new tab to GitHub
- Approve GitHub access to connect your account

4. Link a GitHub Repository

- Now you'll see two options:
    - Create a new private repository   ○ Link an existing repository

In my case, I wanted to linked it to:

- [Runarok/GeeksForGeeks-solutions](#)

So I just typed: GeeksForGeeks-solutions

You will see a message like:

- Successfully linked Runarok/GeeksForGeeks-solutions to 'GfG To GitHub'. Start solving on GeeksforGeeks now! Linked the wrong repo? → Unlink.

## 5. Start Solving — It Auto Uploads!

Now just:

- Solve a problem on GeeksforGeeks
- Once submitted successfully:
    - The extension will automatically push the solution to your linked GitHub repo
    - Files will be neatly named and added to language-specific folders

Note: *Wait about 30 seconds after solving before refreshing GitHub — it usually pushes within that time*
(Just don't refresh GFG instantly — let it sync first)

Track Your Growth Publicly

- Check out an example of how an organized, synced repo looks:
  - [GeeksForGeeks-solutions](#)

Runarok/GeeksForGeeks-solutions: This repository contains solutions to various problems from...

- And my GFG profile if you're curious:
  - [geeksforgeeks/runarokhrafn](#)
